Neuroimaging

Data Analysis

Rational

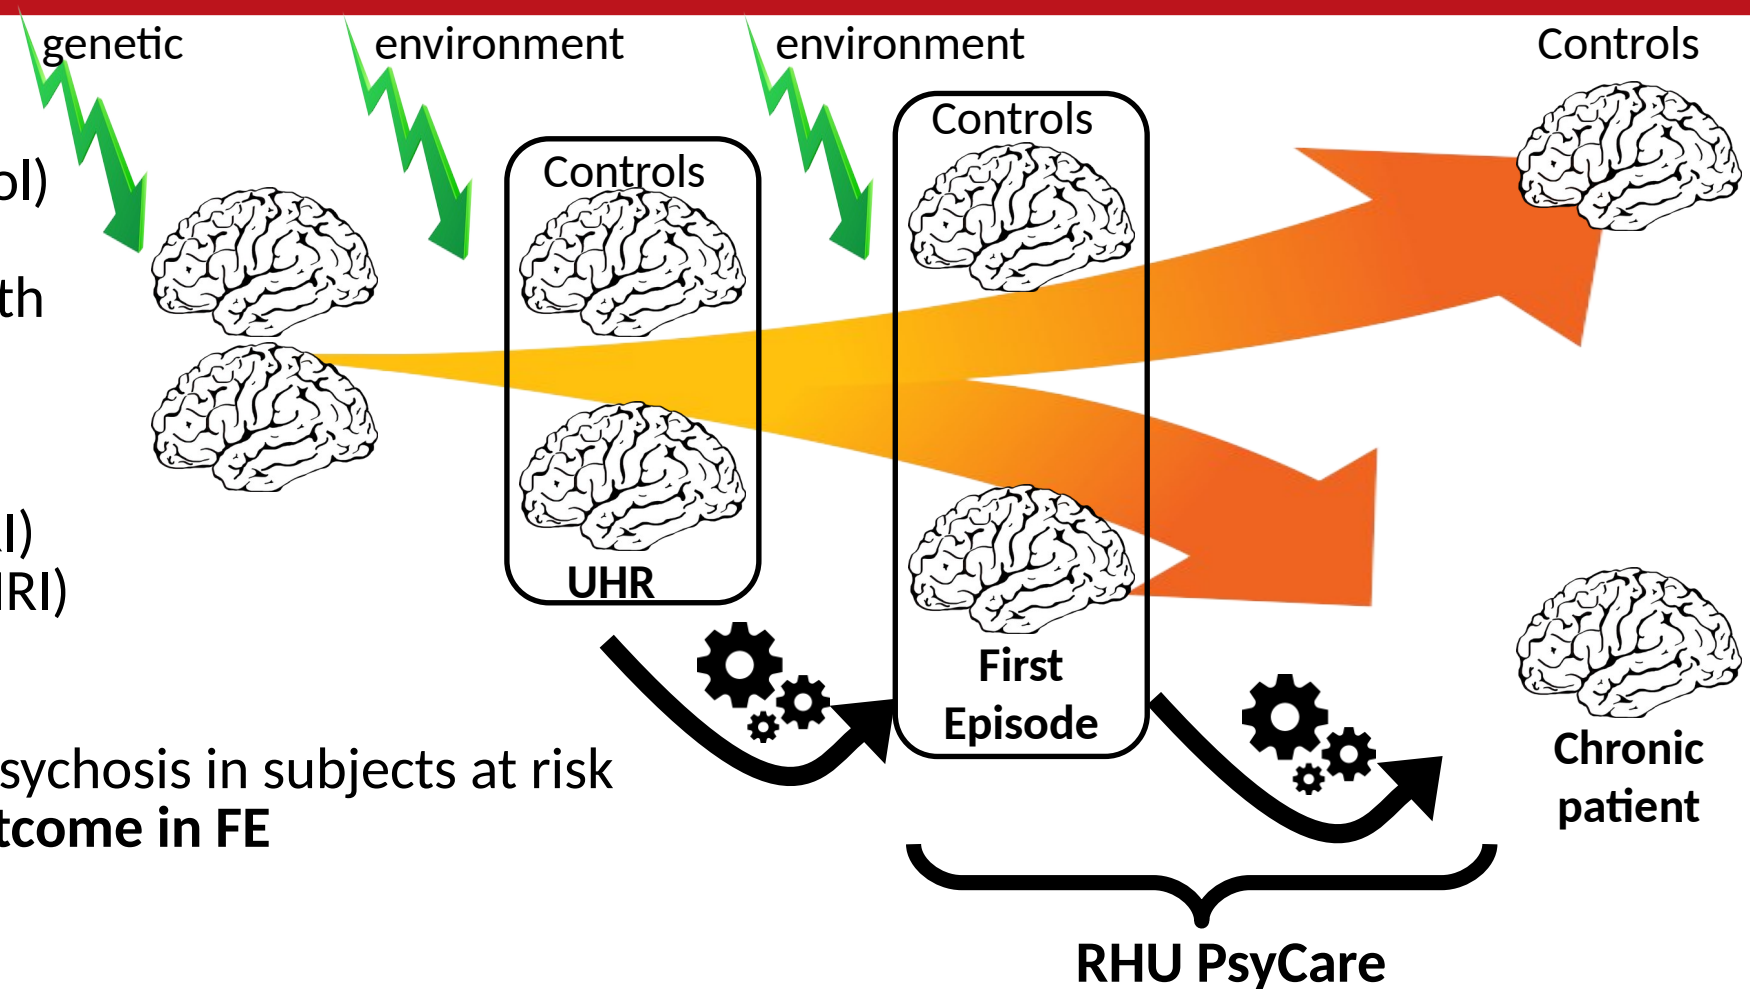

- Genetic and environment (trauma, stress, toxic, alcohol) modify the trajectory of the brain development from birth to young adults.
- Subtle differences in brain functioning (fMRI) anatomy (sMRI) or connectivity (dMRI) and metabolism (PET and MRI)

Goal

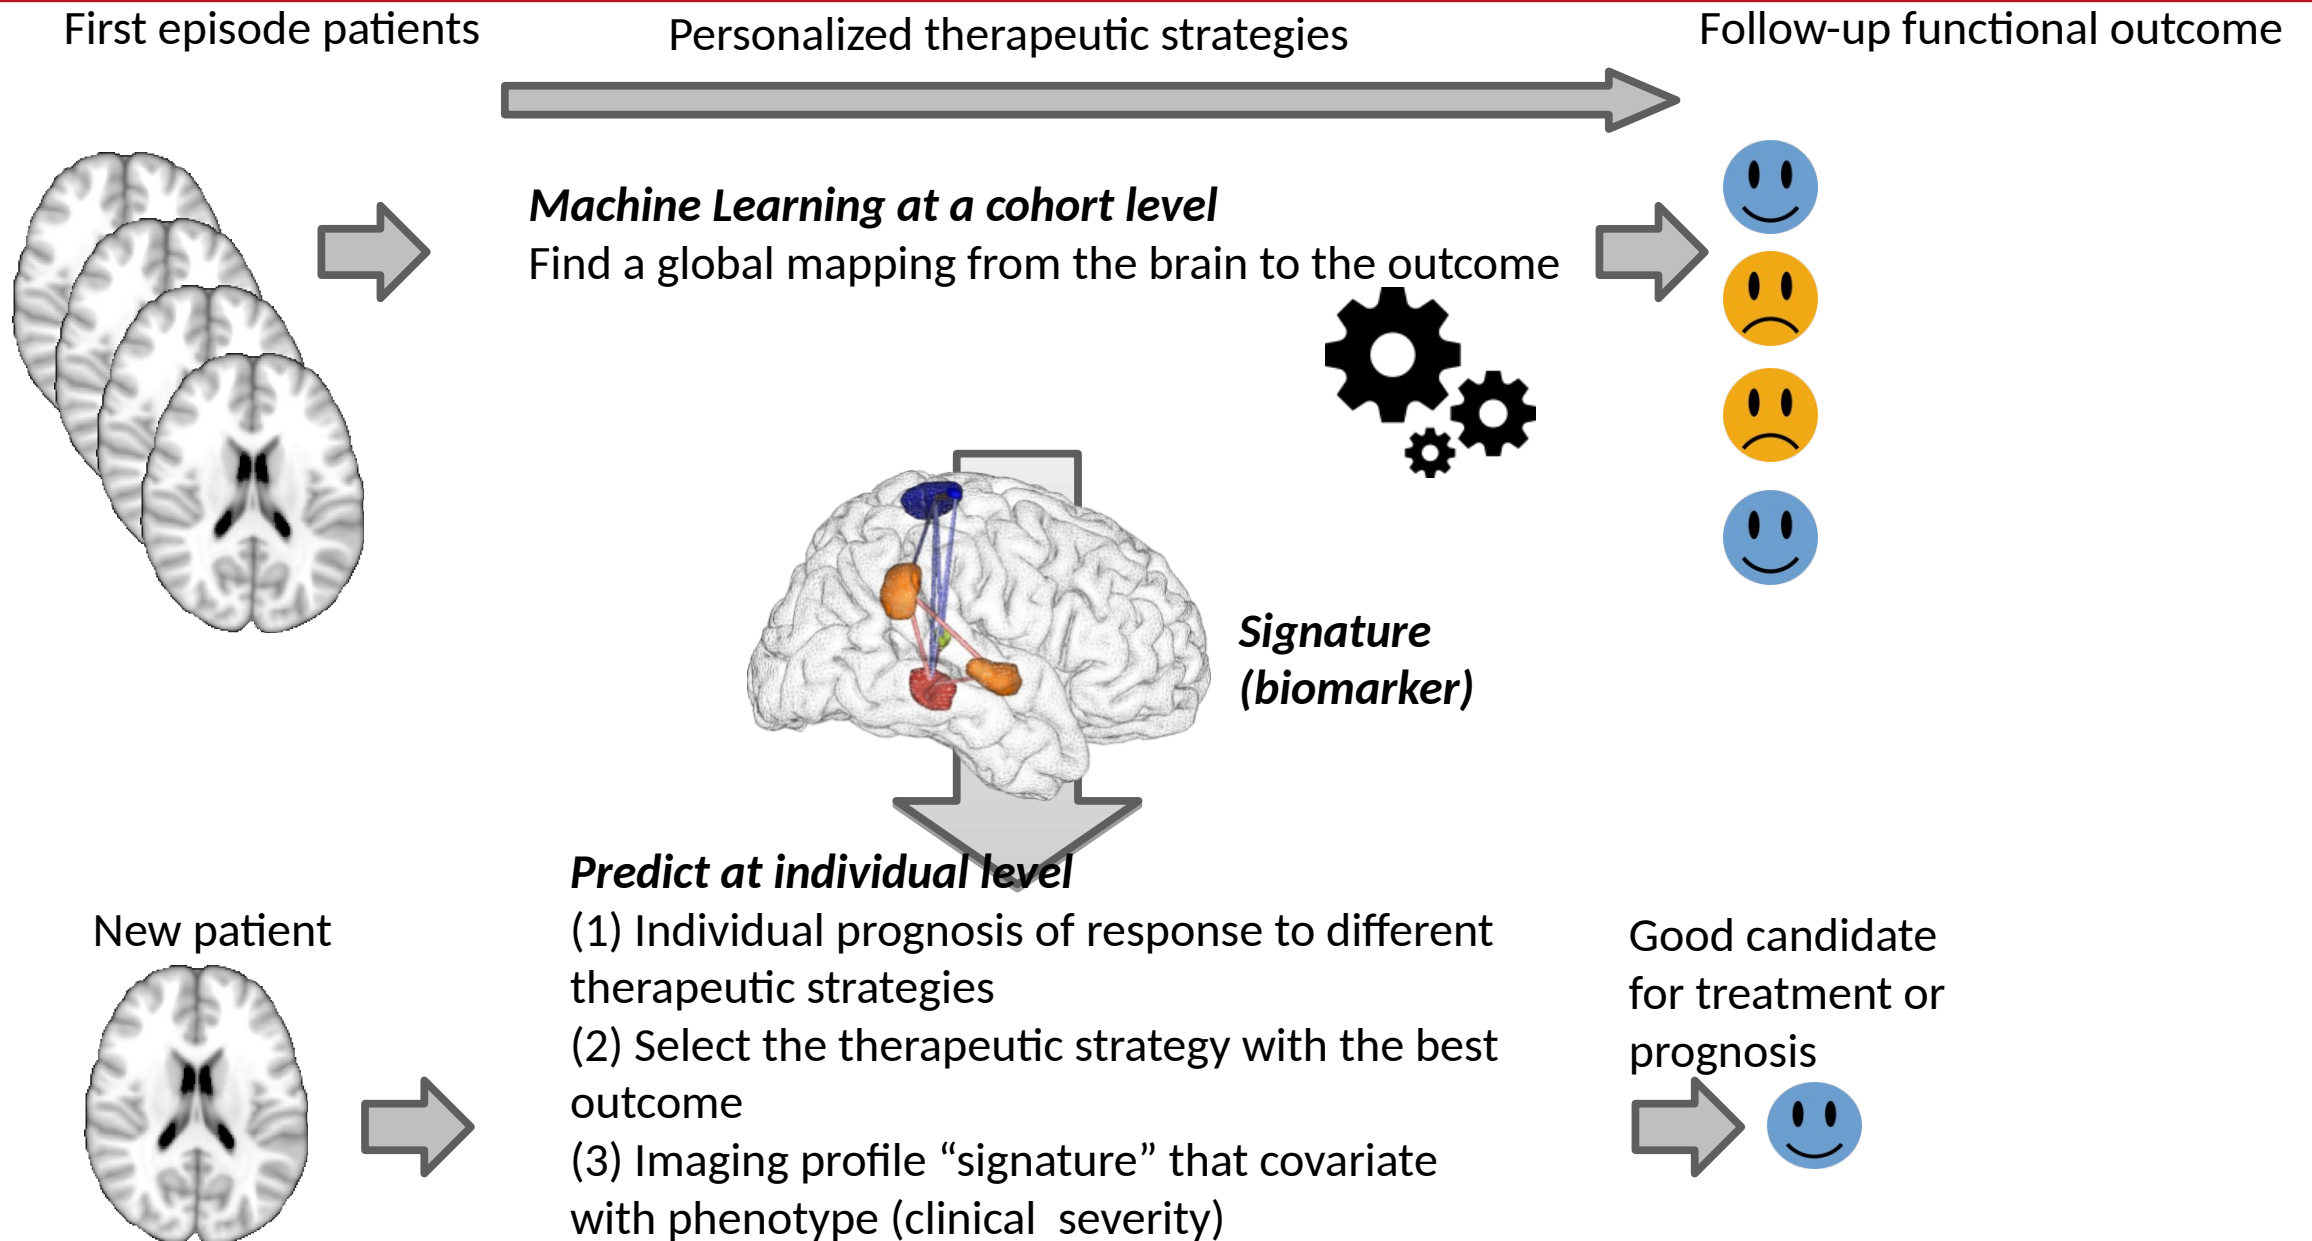

- Prognostic of transition to psychosis in subjects at risk
- **Prognostic of functional outcome in FE**

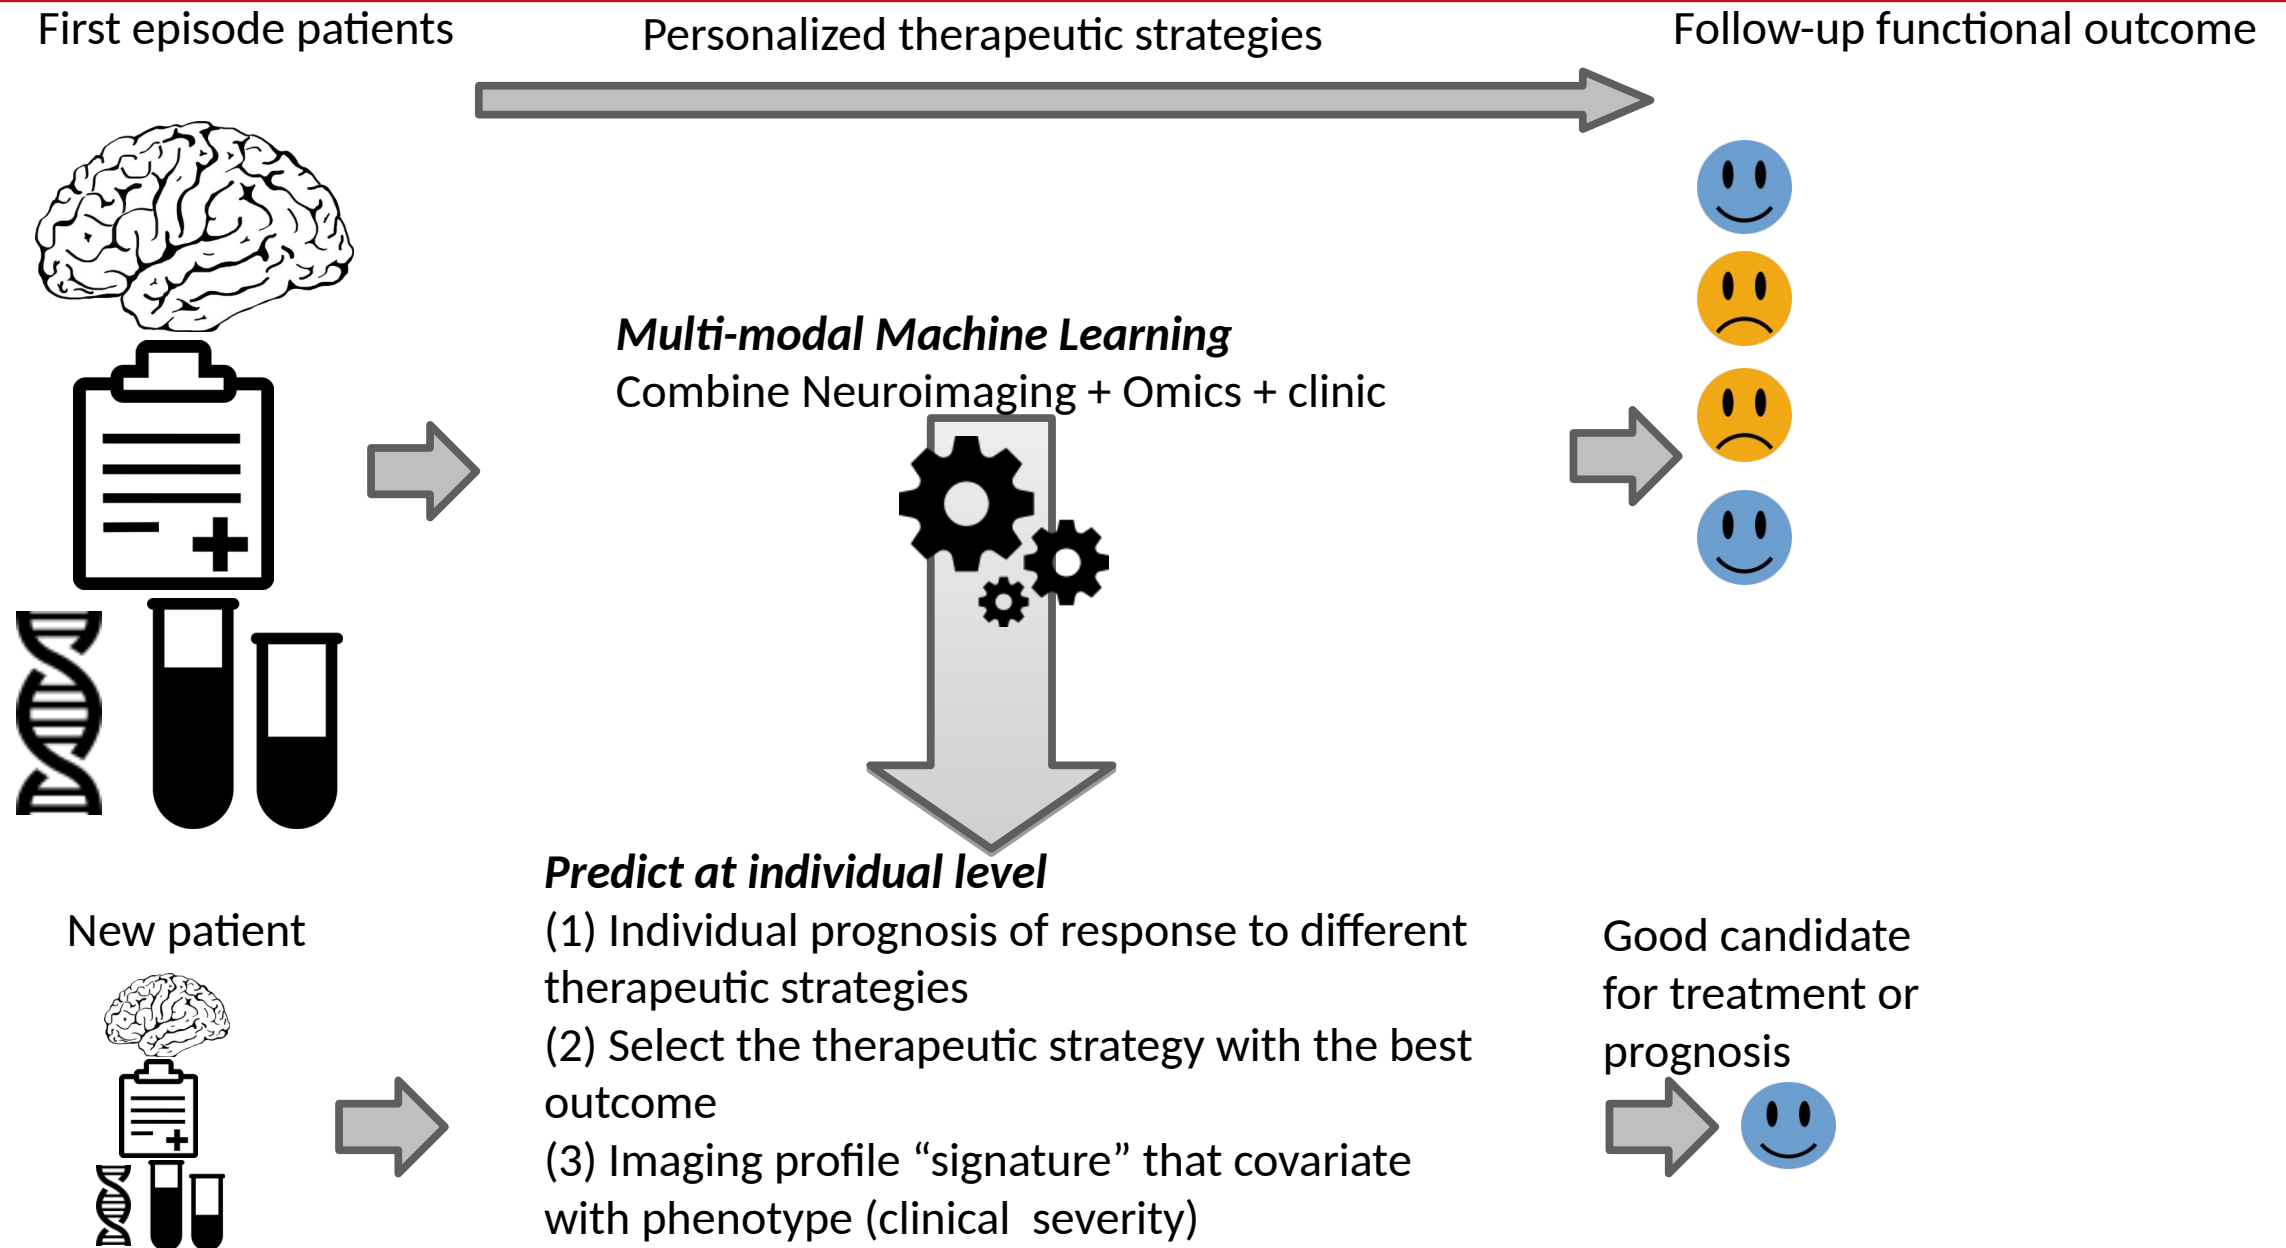

Methods

- Supervised machine learning algorithms can **capture those brain patterns**
- Learn to predict the outcome from past brain scans at early stage of the disorder progression
- Provide prognostic information about the patient evolution toward psychiatric disorders (depression, schizophrenia, bipolar-disorder).

Methods: Machine learning to predict the clinical outcome

cea Neuroanatomical Signature of Schizophrenia that generalizes to first episode

1) Learn a Predictive signature on patients with chronic SZ and controls

2) Discriminate first episode from controls

3) Perspectives: brain score of disorder progression

[De Pierrefeu Acta Psychiatrica Scandinavica, 2018]

Functional MRI Activation Patterns to Predict hallucinations in Schizophrenia for neurofeedback

1) rest functional MRI during hallucination

2) Learn functional signature of hallucination

Predictive signature:
Broca's area and its right homologue

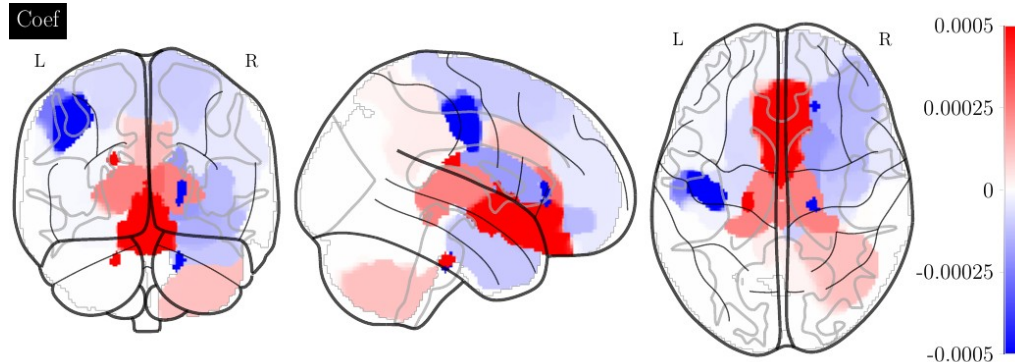

3) Decoding
4) Neuro-feedback

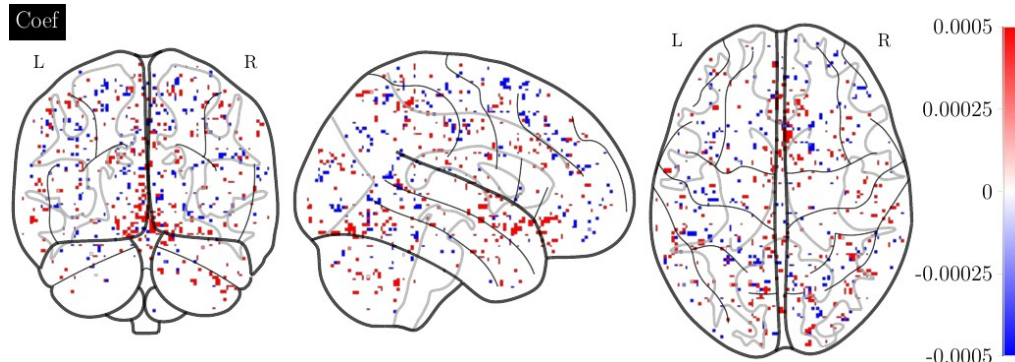

[De Pierrefeu Hum. Brain Map., 2018]
